Leak Detection

organic veggie food GmbH, based in Bad Endorf in Upper Bavaria, is using Ishida X-ray inspection, Ishida checkweighers and Ishida AirScan leak detection systems to ensure that its range of SOTO specialities - delicious ready-to-eat vegetarian and vegan organic products – reach their customers in premium condition.

Objective/Challenge

A pioneer in the organic food industry, the company prides itself not only on its rigorously organic production, but also on the flawless quality of its products. “Consumer protection is a top priority and I prefer to have no complaints whatsoever,” explains organic veggie food’s managing director Maria Schramm. “Product safety in particular is an area where it makes sense to automate.”

Solution

Detecting foreign bodies

As part of the expansion of its production, organic veggie food GmbH have built a new facility and invested in fully automated quality control systems for two of its packing lines. When organic veggie food replaced its existing metal detectors with Ishida IX-GN X-ray inspection systems, they have found the ability to detect more than metallic foreign bodies an important benefit.

"Because the raw materials in our products are all plant-based, they sometimes contain natural contaminants such as very small stones or grains of sand," says Maria Schramm. "We can rely on the new Ishida X-ray systems to reject packed items found to contain such contaminants." The systems also detect plastics and glass.

Reliable detection

Trusted supplier

"This high performance was the main factor in our decision as Ishida offered the best detection accuracy of all the candidates in our initial supplier selection process."

The patented technology behind Ishida's IX-GN X-ray inspection systems is based on software featuring an intelligent Genetic Algorithm (GA). There are seven detection levels with the first three focused on different sizes of contaminants and the last four offering GA imaging.

Smart x-ray inspection

Intelligent software

GA imaging allows the user to select or set up particular image filtering that offers excellent detection of low-density contaminants. In addition, product-in-seal software can spot any product particles in the sealing seams that could inhibit pack integrity.

Case Study

Soto

The Ishida IX-GN models are able to handle organic veggie food's entire range of products in their different pack formats. Around 40 chilled and frozen products with fill weights ranging from 150g to 2.5kg are packed into bags, trays, and cardboard boxes on the two lines.

200
pre-sets

There are as many as 200 pre-sets for frequent product changes, and Maria Schramm praises the X-ray inspection systems for their “extremely sensitive and accurate adjustability.”

organic veggie food employs Ishida checkweighers on the packing lines to check compliance with statutory weight regulations. The Ishida checkweighers are exceptionally accurate with its large weighing range, that offers tremendous flexibility.

Accurate
weighing

Switch
weight range

The operator can switch between two weight range settings with different graduations at the touch of a button. This means that the checkweigher can be used for a wider range of products.

The robust design also features a ‘dislocating force limiter’ function, which disconnects the highly sensitive weighing sensor from the belt before it can suffer any permanent damage from external impacts. It then immediately resumes operation.

Robust
design

In-line
leak detection

SOTO specialities are free of preservatives, and an intact protective atmosphere is essential to guarantee the products' shelf life. For this reason, they undergo a fully automated leak testing process before end-of-line packing.

Case Study

Soto

The Ishida AirScan systems use laser technology to detect leaks of carbon dioxide (CO₂) from the modified atmosphere of the packaging. The high-performance systems inspect every single pack from all sides in less than 20 milliseconds. They are able to find leaks in the sealing seams and holes as small as 0.25 mm at speeds of up to 180 packs per minute, while the completely non-destructive inspection process cuts material costs as well.

Laser
technology

Easy to
operate

The Ishida AirScan systems are very easy to operate and require almost no maintenance. No adjustments to settings are needed for product changeovers; only the height-adjustable control arm with the sensor head has to be altered to the different pack heights.

Customer Satisfaction

"The leak detection process with the Ishida AirScan systems has definitely taken our internal quality assurance procedure to a whole new level," confirms Maria Schramm.

Visual
Reporting

organic veggie food is also now employing its new quality control systems to further optimise the packing processes for its SOTO specialties.

The Ishida Sentinel™ online tool uses this information to anticipate machine faults or drops in performance. Trends, batch information and statistics can be visualised on a case-by-case basis and sent out as reports.

Case Study

Soto

“Our company’s recipe for success is that we are flexible, fast, inquisitive and open-minded,” concludes Maria Schramm. “We apply that approach to the technology we use as well.” Indeed, the company has already ordered another X-ray inspection system from Ishida.

About organic veggie food GmbH

Founded in 1988, organic veggie food GmbH is a family-run business with around 100 employees. The company uses only raw ingredients sourced from fully controlled organic farming with no additives, preservatives, or palm oil. The ready-to-eat food products are available in organic food shops, organic supermarkets and health food shops, and also supplied to wholesalers.

They are sold all over Europe under the company’s own SOTO and Lotus Natur brands.
